AgentShield Autopilot — 3-Minute Demo Script

Nebius x NVIDIA Global AI Hackathon · Coding & Agentic Engineering Track

Target Length: 2m 45s - 3m 00s (Strict limit: 180s)

Model: NVIDIA Nemotron 3.5 (30B Lightning)

Screen Setup: 1080p (1920x1080) at 100% browser zoom

Local URL: http://localhost:5173/autopilot

Audio: Crisp microphone narration, energetic tone

Docker: agentshield-autopilot-pytest:2026-10 active

Timed Scene-by-Scene Director's Cut

Timestamp	On-Screen Visual	Spoken Narration (What to Say)
0:00 - 0:40 (40s)	**App Shell / Title** • Show browser at /autopilot • Point to top nav & status indicator: *Running Live · NVIDIA Nemotron*	*"Autonomous coding agents are reshaping software development. But giving an LLM direct access to write, patch, and execute code is dangerous—they can hallucinate, tamper with system binaries, escape sandboxes, or leak production secrets.* *Meet **AgentShield Autopilot**: a production runtime governance platform for AI coding agents, powered by **NVIDIA Nemotron** and containerized test isolation."*
0:40 - 1:55 (75s)	**Autopilot Live Run** • Select buggy-auth • Click **Start coding job** • Show baseline fail (exit 1) • Watch Nemotron read files • Show Gates 1 & 2 approving • Highlight unified patch diff • Show container test turn GREEN (exit 0)	*"Here is Autopilot in action. We select a broken authentication fixture where the session expiry comparison is inverted.* *1. Our disposable non-root Docker container executes the baseline test suite with zero network access: six tests fail.* *2. **NVIDIA Nemotron 3.5** begins exploring the repository. Notice every single tool call is intercepted by AgentShield: Gate 1 checks intent, and Gate 2 validates resource permissions and file content hashes.* *3. Nemotron pinpoints the bug in app/auth.py, generating an atomic diff fixing now >= expires_at to now < expires_at.* *4. The container re-runs pytest in complete isolation: all eight tests pass! exit code zero."*
1:55 - 2:30 (35s)	**Office Simulation** • Click /office in top nav • Show 5-room Canvas floor • Show walking employees & halos • Highlight System Log rail showing *Blocked by Gate 2*	*"AgentShield monitors entire multi-agent environments. On the **Office Simulation**, twenty autonomous agents execute daily developer tasks. Every agent has real-time FSM states, halos, and anomaly scores calculated by an Isolation Forest.* *When an agent attempts an unauthorized action—like accessing a production secret or performing directory traversal—AgentShield Gate 2 blocks the action instantly in the system log."*

2:30 - 3:00 (30s)	**Telemetry & Conclusion** • Return to /autopilot • Point to token counter & model latency • Click **Download report** • Open the JSON report	*"Autopilot tracks exact token usage and latency—over 6,000 real input tokens and genuine tool calling with zero mock substitutions. By clicking 'Download report', security teams receive a cryptographically signed JSON audit receipt of the entire job.* *AgentShield turns autonomous coding into a governed, verifiable, and enterprise-grade reality. Built with NVIDIA Nemotron on open infrastructure. Thank you!"*

Director's Recording Tips:

• **Mouse Movement:** Move the cursor deliberately; hover over the Gate 1/2 badges, the unified diff, and the 'PASS · exit 0' pill.
• **Smooth Transitions:** Keep both /autopilot and /office open in tabs so switching takes 0.5 seconds.
• **Key Talking Point:** Emphasize *'NVIDIA Nemotron 3.5'* and *'Docker container isolation with zero network'* to hit hackathon judging criteria.
• **Pacing:** If Nemotron finishes in 20 seconds, pause for 3 seconds to let the audience appreciate the green pass badge before switching tabs.
